HOW TO INSTALL A RAIN BARREL

Select Your Location

- Place the barrel under a downspout where most water flows during rainfall.
- If no downspout is available, choose a spot where water naturally collects. You may capture water directly or use a rain chain.

Build a Stable Base

- Ensure the ground is level and cleared.
- Elevate the barrel 6–16 inches on a flat, level, and sturdy base to improve water pressure.

Manage Water Flow

- Cut the downspout so it directs water into the barrel's top opening.
- Keep mesh cover in place to block debris and mosquitoes.
- Position the barrel securely on the base with the spigot facing outward.
- Attach a hose to the overflow port and direct excess water away from the building foundation.
